IR Detector for Mid Range Proximity Sensor

DESCRIPTION
The TSSP57P38 is a compact infrared detector module for proximity sensing application. It receives 38 kHz modulated signals and has a peak sensitivity of 940 nm. The length of the detector’s output pulse varies in proportion to the amount of light reflected from the object being detected.

FEATURES
• Height of 0.8 mm
• Up to 2 m for proximity sensing
• Receives 38 kHz modulated signal
• Photo detector and preamplifier in one package
• Low supply current
• Shielding against EMI
• Visible light is suppressed by IR filter
• Insensitive to supply voltage ripple and noise
• Supply voltage: 2.5 V to 5.5 V
• Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

APPLICATIONS
• Object approach detection for activation of displays and user consoles, signaling of alarms, etc.
• Simple gesture controls
• Differentiation of car arrival, static, car departure in parking lots
• Reflective sensors for toilet flush
• Navigational sensor for robotics

Note

- Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect the device reliability.

- **Fig. 5 - Sensitivity vs. Supply Voltage Disturbances**

- **Fig. 6 - Output Pulse Width vs. Irradiance**

---

**Correlation with Ambient Light Sources:**
- \( 10 \, \text{W/m}^2 = 1.4 \, \text{kLx} \) (Std. Illum. A, \( T = 2855 \, \text{K} \))
- \( 10 \, \text{W/m}^2 = 8.2 \, \text{kLx} \) (Daylight, \( T = 5900 \, \text{K} \))

**Wavelength of Ambient Illumination:** \( \lambda = 950 \, \text{nm} \)
The typical application of the TSSP57P38 is a reflective sensor with analog information contained in its output. Such a sensor is evaluating the time required by the AGC to suppress a quasi continuous signal. The time required to suppress such a signal is longer when the signal is strong than when the signal is weak, resulting in a pulse length corresponding to the distance of an object from the sensor. This kind of analog information can be evaluated by a microcontroller. The absolute amount of reflected light depends much on the environment and is not evaluated. Only sudden changes of the amount of reflected light, and therefore changes in the pulse width, are evaluated using this application.

Example of a signal pattern:

```
Optical signal
```

```
Response of the TSSP57P38 (strong reflection)
```

```
Response of the TSSP57P38 (weak reflection)
```

Example for a sensor hardware:

```
Emitter

TSAL6200

Separation to avoid crosstalk by stray light inside the housing

TSSP57P38

IR Receiver
```

There should be no common window in front of the emitter and receiver in order to avoid crosstalk by guided light through the window.

The logarithmic characteristic of the AGC in the TSSP57P38 results in an almost linear relationship between distance and pulse width. Ambient light has also some impact to the pulse width of this kind of sensor, making the pulse shorter.

ASSEMBLY INSTRUCTIONS

Reflow Soldering

• Reflow soldering must be done within 168 h while stored under a max. temperature of 30 °C, 60 % RH after opening the dry pack envelope.
• Set the furnace temperatures for pre-heating and heating in accordance with the reflow temperature profile as shown in the diagram. Exercise extreme care to keep the maximum temperature below 260 °C. The temperature shown in the profile means the temperature at the device surface. Since there is a temperature difference between the component and the circuit board, it should be verified that the temperature of the device is accurately being measured.
• Handling after reflow should be done only after the work surface has been cooled off.

Manual Soldering

• Use a soldering iron of 25 W or less. Adjust the temperature of the soldering iron below 300 °C.
• Finish soldering within 3 s.
• Handle products only after the temperature has cooled off.

The sealed reel is packed into a cardboard box.

| **LABEL** |

Standard bar code labels for finished goods

The standard bar code labels are product labels and used for identification of goods. The finished goods are packed in final packing area. The standard packing units are labeled with standard bar code labels before transported as finished goods to warehouses. The labels are on each packing unit and contain Vishay Semiconductor GmbH specific data.

| **RECOMMENDED METHOD OF STORAGE** |

Dry box storage is recommended as soon as the aluminum bag has been opened to prevent moisture absorption. The following conditions should be observed, if dry boxes are not available:

- Storage temperature 10 °C to 30 °C
- Storage humidity ≤ 60 % RH max.

After more than 168 h under these conditions moisture content will be too high for reflow soldering.

In case of moisture absorption, the devices will recover to the former condition by drying under the following condition:

192 h at 40 °C + 5 °C / - 0 °C and < 5 % RH (dry air / nitrogen) or
96 h at 60 °C + 5 °C and < 5 % RH for all device containers or
24 h at 125 °C + 5 °C not suitable for reel or tubes.

An EIA JEDEC® standard J-STD-020 level 3 label is included on all dry bags.
ESD PRECAUTION

Proper storage and handling procedures should be followed to prevent ESD damage to the devices especially when they are removed from the antistatic shielding bag. Electrostatic sensitive devices warning labels are on the packaging.

VISHAY SEMICONDUCTORS STANDARD BAR CODE LABELS

The Vishay Semiconductors standard bar code labels are printed at final packing areas. The labels are on each packing unit and contain Vishay Semiconductors specific data.
