**IR Receiver Modules for Remote Control Systems**

### FEATURES
- Improved immunity against HF and RF noise
- Low supply current
- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- Supply voltage: 2.5 V to 5.5 V
- Improved immunity against optical noise
- Insensitive to supply voltage ripple and noise
- Compatible with wave or reflow soldering (see “P” version of Minimold option datasheets)

### DESCRIPTION
The TSOP531.., TSOP533.., and TSOP535.. series are miniaturized IR receiver modules for infrared remote control systems. A PIN diode and a preamplifier are assembled on lead frame, the epoxy package contains an IR filter. The demodulated output signal can be directly connected to a microprocessor for decoding.

The TSOP533.. series devices are optimized to suppress almost all spurious pulses from Wi-Fi and CFL sources. They may suppress some data signals if continuously transmitted.

The TSOP531.. series devices are provided primarily for compatibility with old AGC1 designs. New designs should prefer the TSOP533.. series containing the newer AGC3.

The TSOP535.. series are useful to suppress even extreme levels of optical noise, but may also suppress some data signals. Please check compatibility with your codes.

These components have not been qualified according to automotive specifications.

- **Package**: Minimold
- **Pinning**: 1 = OUT, 2 = GND, 3 = VS
- **Dimensions (mm)**: 5.4 W x 6.35 H x 4.9 D
- **Mounting**: Leaded
- **Application**: Remote control
- **Best choice for**: (1) MCIR (2) Mitsubishi (3) RECS-80 Code (4) r-map (5) XMP-1

**Note**
- Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect the device reliability.

SUITABLE DATA FORMAT

This series is designed to suppress spurious output pulses due to noise or disturbance signals. The devices can distinguish data signals from noise due to differences in frequency, burst length, and envelope duty cycle. The data signal should be close to the device’s band-pass center frequency (e.g. 38 kHz) and fulfill the conditions in the table below.

When a data signal presented to the device in the presence of a disturbance, the sensitivity of the receiver is automatically reduced by the AGC to insure that no spurious pulses are present at the receiver’s output. Some examples which are suppressed are:

- DC light (e.g. from tungsten bulbs sunlight)
- Continuous signals at any frequency
- Strongly or weakly modulated patterns from fluorescent lamps with electronic ballasts (see Fig. 13 or Fig. 14).
- 2.4 GHz and 5 GHz Wi-Fi

**Note**

- For data formats with long bursts (more than 10 carrier cycles) please see the datasheet for TSOP532.., TSOP534..
BULK PACKAGING
Standard shipping for minimold is in conductive plastic bags. The packing quantity is determined by weight and a maximum of 0.3% of the components per carton may be missing.
