CHOICE OF THE HEATSINK

The user must choose according to the working conditions of the component (power, room temperature).
Maximum working temperature must not exceed 175 °C. The dissipated power is simply calculated by the following ratio:

$$P = \frac{\Delta T}{[R_{TH\ (j-c)}] + [R_{TH\ (c-h)}] + [R_{TH\ (h-a)}]} \quad (1)$$

P: expressed in W

ΔT: difference between maximum working temperature and room temperature

$R_{TH\ (j-c)}$: thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component

$R_{TH\ (c-h)}$: thermal resistance value measured between outer side of the resistor and upper side of the heatsink. This is the resistance of the interface (grease, thermal pad), and the quality of the fastening device

$R_{TH\ (h-a)}$: thermal resistance of the heatsink

Example:

$R_{TH\ (c-h)} + R_{TH\ (h-a)}$ for LTO 150 power rating 10 W at ambient temperature +25 °C

Thermal resistance $R_{TH\ (j-c)}$: 0.87 °C/W

Considering equation (1) we have:

$\Delta T = 175\ °C - 25\ °C = 150\ °C$

$R_{TH\ (j-c)} + R_{TH\ (c-h)} + R_{TH\ (h-a)} = \frac{\Delta T}{P} = \frac{150}{10} = 15\ °C/W$

$R_{TH\ (c-h)} + R_{TH\ (h-a)} = 15\ °C/W - 0.87\ °C/W = 14.13\ °C/W$

Example with a thermal grease $R_{TH\ (c-h)} = 0.5\ °C/W$, we need a heatsink with $R_{TH\ (h-a)} = 13.63\ °C/W$

CLIP MOUNTING RECOMMENDATION

To improve the thermal conductivity, all surface of ceramic has to be coated with a thermal silicon grease. If you not use our clipped or screwed clip, it is recommended that a mounting force of 60 N to 110 N be applied to the center of the molding case of the component. Tightening torque 2 Nm when mounting screwed clip MAX08NG on heatsink.
