Spotlight on NTC Thermistor Curve Calculator

Vishay’s new NTC Thermistor Curve Calculator is a free program. In order to compute a resistance temperature curve for a Vishay NTC thermistor, you will need to download our program "My Vishay NTC Curve." When the user inputs a Vishay NTC thermistor part number, this program will supply the full nominal resistance temperature curve, together with the tolerances. All the specific corresponding Steinhart and Hart equations are supplied as well. Every NTC thermistor part number on the Vishay website is covered by this program.

Data output is directly available in Excel. Each computed resistance temperature is saved in a directory chosen by the user and determined at the time of program installation. At any further opening, the curves can be moved to another directory. Update verification is provided each time that the program is opened. If an update is available, a link leads the user to the relevant web page. This enables the user to be updated on new RT curves on the Vishay website.

In the “My Vishay NTC Curve” program, you can type in a valid Vishay NTC part number or copy/paste the part number from another application. The different part numbers included in this application begin with the three characters NTC (like NTCLE100E3103/J00), with the four characters NTHS (like NTHS0805N01N1002J), or with a sequence consisting of a two-digit number followed by a letter (like 01M). Old 12-digit part numbers from the BCcomponents era (like 2381 640 55103) are also accepted.

The curves are computed between the limits of the temperature range defined in the datasheet, but the user can limit the table by choosing the minimum and maximal temperature of his own application. A temperature step of 5 °C is common, but it can be reduced down to 0.1 °C. The user can select either the degree Fahrenheit (°F) or degree Celsius (°C) temperature scale.

Spotlight on MELF Resistors
The World’s Most Reliable and Predictable High-Performance Film Resistors

For more than 25 years, Vishay’s MELF resistors have successfully met the demanding requirements of the automotive industry. They offer superior SMD resistor performance in terms of accuracy, stability, reliability, and pulse load capability. The cylindrical construction of MELF devices provides an optimal power rating and pulse load capability related to the mounting space. Continuous development has led to improved long-term stability and moisture resistance, and allows high-temperature operation to +175 °C.

KEY PERFORMANCE BENEFITS:
• Predictable behavior of components
• Zero-defect philosophy
• Harsh operating environments
• Long-term stability
• Moisture resistance
• Reliability
• Temperature cycling in lead (Pb)-free assembly processes
• Insulation voltage up to 500 V

APPROVALS
• EN140401-803
• AEC-Q200

All products are completely lead (Pb)-free and comply with the Global Automotive Declarable Substances List (GADSL), which includes full compliance with the RoHS directive.

TEMPERATURE COEFFICIENT, TOLERANCE, AND STABILITY
Resistor temperature coefficients down to ± 5 ppm/K are available, as well as tolerances down ± 0.02 %. Long-term stability results in a superior maximum resistance change (ΔR/R) of < ± 0.05 % after 8000 h operation for high-precision MELF resistors.

PULSE LOAD CAPABILITY
Another aspect of MELF resistors is their reliability when exposed to various overload conditions. The metal film technology, together with the cylindrical construction of the MELF devices, provides an advantage compared to standard thick and thin film chip resistors in regard to pulse load capability. MELF resistors are also available in advanced carbon film technology, offering up to 6 kV ESD capability on the 1206 pad size, or 10 kV surge handling on the 2512 pad size. As shown in the diagram below, thick film flat chip resistors fail at much lower pulse loads than thin film flat chips, and both types are outperformed by thin film MELF resistors.

Spotlight on the IHLP® Inductor Loss Calculator Tool

Vishay’s “IHLP Core Loss Calculator” is a free tool that assists designers in selecting the proper IHLP inductor based on the operating conditions of their circuit. This tool will simulate the losses in the inductor, including core and both AC and DC copper losses. The temperature rise and final component temperature will also be predicted based on the estimated losses. This tool will allow designers to compare several different inductors, both in size and value, to assist in the selection process. The calculator can be used for buck, boost and buck/boost style converters.

The calculator requires eight inputs: input voltage, output voltage, switch (FET) voltage drop, diode (or sync FET) voltage drop, output current, frequency, ambient temperature and inductance. The calculator will do the rest based on these inputs. Inductance can be selected by using the “radio” buttons on the left hand side.

Please note: all designs should be verified in circuit as this tool is for simulation only.

Important Design Criteria

IHLP inductors have a recommended maximum component temperature based on materials (see spec sheet). Subtracting the ambient temperature will give us the maximum allowed temperature rise for the part. If this number should exceed 40 °C it is recommended that 40 °C be used for the allowed temperature rise. It is recommended that core losses be limited to ≤ 1/3 of the total losses to mitigate any aging effects associated with the powdered iron in the core at temperatures exceeding the maximum temperature of the part. The recommended range for the ripple current is 30% to 50% of inductor current. This is based on a trade off of inductor size and cost versus output capacitor size and cost. The maximum peak current should be kept below the \( I_{\text{ms}} \) value of the selected inductor, although it can be exceeded with caution due to the soft saturation characteristics of the powdered iron core material. The calculators are based on operation in the continuous conduction mode only, information determined in the discontinuous conduction mode should be considered suspect and in need of verification by the user.
