Surface Mount Power Resistor
Thick Film Technology

FEATURES
- AEC-Q200 qualified
- 20 W at 25 °C case temperature
- Surface mounted resistor - TO-263 (D²PAK) style package
- Wide resistance range from 0.01 Ω to 550 kΩ
- Non inductive
- Resistor isolated from metal tab
- Solder reflow secure at 270 °C/10 s
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

DESIGN SUPPORT TOOLS AVAILABLE

DIMENSIONS in millimeters

Notes
- For the assembly on board, we recommend the lead (Pb)-free thermal profile as per J-STD-020C
- Power dissipation is 3.1 W at an ambient temperature of 25 °C when mounted on a double sided copper board using FR4 HTG, 70 μm of copper, 39 mm x 30 mm x 1.6 mm, with thermal vias

**CHOICE OF THE BOARD**

The user must choose the board according to the working conditions of the component (power, room temperature). Maximum working temperature must not exceed 175 °C. The dissipated power is simply calculated by the following ratio:

\[ P = \frac{\Delta T}{R_{TH (j - c)} + R_{TH (c - h)} + R_{TH (h - a)}} \]  

(1)

\( P \): Expressed in W

\( \Delta T \): Difference between maximum working temperature and room temperature or fluid cooling temperature

\( R_{TH (j - c)} \): Thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component: 6.5 °C/W.

\( R_{TH (c - h)} \): Thermal resistance value measured between outer side of the resistor and upper side of the board. This is the thermal resistance of the solder layer.

\( R_{TH (h - a)} \): Thermal resistance of the board.

**Example:**

\( R_{TH (c - h)} + R_{TH (h - a)} \) for D2TO20 power rating 2.5 W at ambient temperature +25 °C.

Thermal resistance \( R_{TH (j - c)} \): 6.5 °C/W

Considering equation (1) we have:

\[ \Delta T = 155 °C - 25 °C = 130 °C \]

\[ R_{TH (j - c)} + R_{TH (c - h)} + R_{TH (h - a)} = \Delta T/P = 130/2.5 = 52 °C/W \]

\[ R_{TH (c - h)} + R_{TH (h - a)} = 52 °C/W - 6.5 °C/W = 45.5 °C/W \]

**Single Pulse:**

These informations are for a single pulse on a cold resistor at 25 °C (not already used for a dissipation) and for pulses of 100 ms maximum duration.

The formula used to calculate \( E \) is:

\[ E = P \times t = \frac{U^2}{R} \times t \]

with:

\( E \) (J): Pulse energy

\( P \) (W): Pulse power

\( t \) (s): Pulse duration

\( U \) (V): Pulse voltage

\( R \) (W): Resistor

The energy calculated must be less than that allowed by the graph.
POWER RATING

The temperature of the case should be maintained within the limits specified.

OVERLOADS

In any case the applied voltage must be lower than the maximum overload voltage of 750 V. The values indicated on the graph below are applicable to resistors in air or mounted onto a board.

ENERGY CURVE

POWER CURVE
**IMPEDEANCE CURVE** 10 Ω to 1 kΩ from 100 kHz to 300 MHz

- **MARKING**
  - Model, style, resistance value (in Ω), tolerance (in %), manufacturing date, Vishay Sfernice trademark

**PACKAGING**
- Reel
- Tube
- Tape dimensions (mm) for reel:
  - 5.3 x 16 x 11 mm
  - 16.4 x 24 mm

**ORDERING INFORMATION**

Optional on request: shape, etc.

**SAP PART NUMBERING GUIDELINES**

- **GLOBAL MODEL**
  - D2TO

- **SIZE**
  - 020

- **LEADS**
  - C = surface mount

- **OHMIC VALUE**
  - The first four digits are significant figures and the last digit specifies the number of zeros to follow. R designates decimal point.
  - 48R70 = 48.7 Ω
  - 48701 = 48 700 Ω
  - 10002 = 100 000 Ω
  - R0100 = 0.01 Ω
  - R6800 = 0.68 Ω
  - 27000 = 2700 Ω = 2.7 kΩ

- **TOLERANCE**
  - F = ± 1 %
  - G = ± 2 %
  - J = ± 5 %
  - K = ± 10 %

- **PACKAGING**
  - R = reel 500 pieces
  - T = tube 50 pieces

- **LEAD (Pb)-FREE**
  - E3 = pure tin
