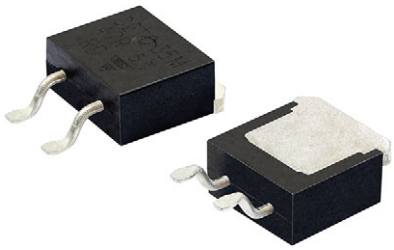
Surface Mount Power Resistor
Multi-Pulses Capabilities



FEATURES

- **AEC-Q200 qualified**
- 35 W at 25 °C case temperature
- Surface mounted resistor - TO-263 (D^2PAK) style package
- Thick film technology
- 100K pulses qualified
- Non inductive
- Resistor isolated from metal tab
- Solder reflow secure at 270 °C/10 s
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

AUTOMOTIVE GRADE

RoHS COMPLIANT

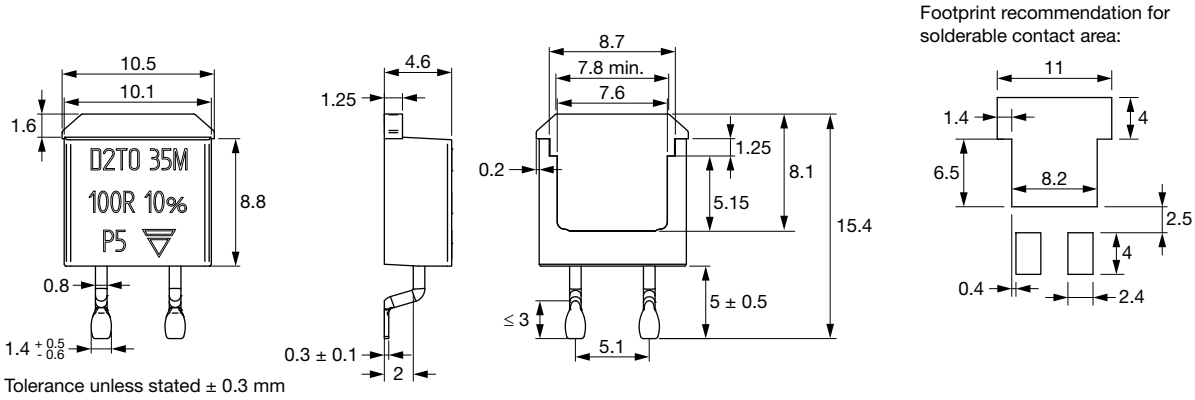
3D Models

For multiple and repetitive pulse use, Vishay develops D2TO35M.

DIMENSIONS in millimeters



Tolerance unless stated ± 0.3 mm

Notes

- For the assembly on board, we recommend the lead (Pb)-free thermal profile as per J-STD-020C
- Power dissipation is 3.5 W at an ambient temperature of 25 °C when mounted on a double sided copper board using FR4 HTG, 70 µm of copper, 39 mm x 30 mm x 1.6 mm, with thermal vias
- Planarity measurement according to JEDEC TO-263D

CHOICE OF THE BOARD

The user must choose the board according to the working conditions of the component (power, room temperature). Maximum working temperature must not exceed 175 °C. The dissipated power is simply calculated by the following ratio:

$$P = \frac{\Delta T}{R_{TH\ (j\ -\ c)} + R_{TH\ (c\ -\ h)} + R_{TH\ (h\ -\ a)}} \quad (1)$$

P: expressed in W

ΔT: difference between maximum working temperature and room temperature or fluid cooling temperature

$R_{TH\ (j\ -\ c)}$: thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component: 4.28 °C/W.

$R_{TH\ (c\ -\ h)}$: thermal resistance value measured between outer side of the resistor and upper side of the board. This is the thermal resistance of the solder layer.

$R_{TH\ (h\ -\ a)}$: thermal resistance of the board.

Example:

$R_{TH\ (c\ -\ h)} + R_{TH\ (h\ -\ a)}$ for D2TO35M power rating 3.5 W at ambient temperature +25 °C.

Thermal resistance $R_{TH\ (j\ -\ c)}$: 4.28 °C/W

Considering equation (1) we have:

$\Delta T = 175\ °C - 25\ °C = 150\ °C$

$R_{TH\ (j\ -\ c)} + R_{TH\ (c\ -\ h)} + R_{TH\ (h\ -\ a)} = \Delta T/P = 150/3.5 = 42.8\ °C/W$

$R_{TH\ (c\ -\ h)} + R_{TH\ (h\ -\ a)} = 42.8\ °C/W - 4.28\ °C/W = 38.52\ °C/W$

Multi-Pulse:

D2TO35M can go up to 100 000 pulses with a drift less than 5 %.

These informations are for a repetitive pulse at 25 °C room temperature.

t_{on} = 500 ms

t_{off} = 11 s

E = 18.9 J

Resistor mounted on a double sided copper board using FR4 HTG, 70 µm of copper, 39 mm x 30 mm x 1.6 mm, with thermal vias.

The formula used to calculate *E* is:

$$E = P \times t = \frac{U^2}{R} \times t$$

with:

E (J): pulse energy

P (W): pulse power

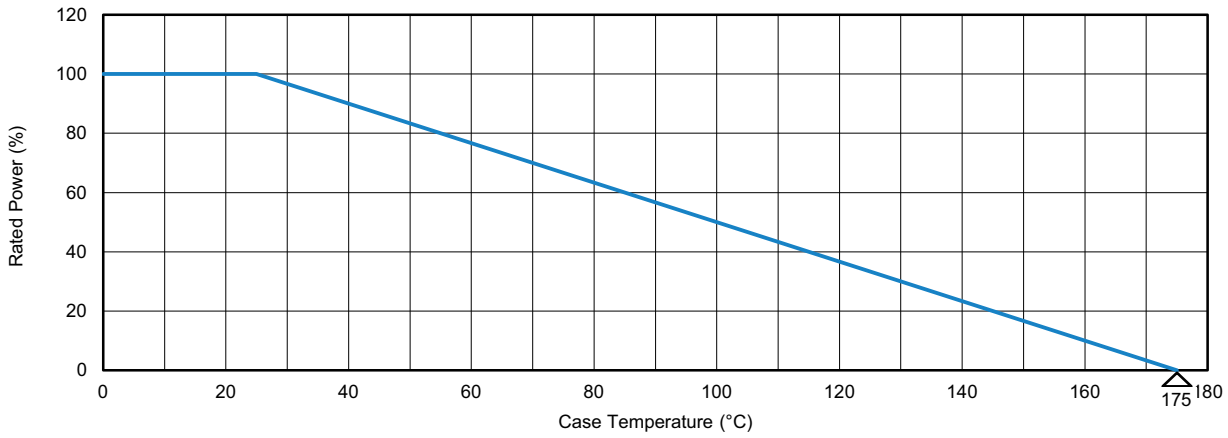
t (s): pulse duration

U (V): pulse voltage

R (Ω): resistor

POWER RATING

The temperature of the case should be maintained within the limits specified.



OVERLOADS

In any case the applied voltage must be lower than the maximum overload voltage of 750 V. The values indicated on the graph below are applicable to resistors in air or mounted onto a board.

ENERGY CURVE

For single pulse, safe operation area for D2TO35M is given by device operation under the defined maximum energy orange curve below.

For repetitive pulse, safe operation area for D2TO35M is given by device operation under the defined maximum energy blue curve below.

Maximum drift 2 % after 1000 pulses.
