Fully Integrated Proximity and Ambient Light Sensor With Infrared Emitter, \( \text{I}^2\text{C} \) Interface, and Interrupt Function

**DESCRIPTION**

The VCNL4020 is a fully integrated proximity and ambient light sensor. Fully integrated means that the infrared emitter is included in the package. It has 16 bit resolution. It includes a signal processing IC and features standard \( \text{I}^2\text{C} \) communication interface. It features an interrupt function.

**APPLICATIONS**

- Proximity sensor for mobile devices (e.g. smart phones, touch phones, PDA, GPS) for touch screen locking, power saving, etc.
- Integrated ambient light function for display/keypad contrast control and dimming of mobile devices
- Proximity / optical switch for consumer, computing and industrial devices and displays
- Dimming control for consumer, computing and industrial displays

**FEATURES**

- Package type: surface-mount
- Dimensions (L x W x H in mm): 4.90 x 2.40 x 0.83
- Integrated modules: infrared emitter (IRED), ambient light sensor (ALS-PD), proximity sensor (PD), and signal conditioning IC
- Interrupt function
- Supply voltage range \( V_{DD} \): 2.5 V to 3.6 V
- Supply voltage range IR anode: 2.5 V to 5 V
- Communication via \( \text{I}^2\text{C} \) interface
- \( \text{I}^2\text{C} \) bus H-level range: 1.7 V to 5 V
- Floor life: 72 h, MSL 4, according to J-STD-020
- Low stand by current consumption: 1.5 \( \mu \)A

**PROXIMITY FUNCTION**

- Built-in infrared emitter and photo-pin-diode for proximity function
- 16 bit effective resolution for proximity detection range ensures excellent cross talk immunity
- Programmable LED drive current from 10 mA to 200 mA in 10 mA steps
- Excellent ambient light suppression by signal modulation
- Proximity distance up to 200 mm

**AMBIENT LIGHT FUNCTION**

- Built-in ambient light photo-pin-diode with close-to-human-eye sensitivity
- 16 bit dynamic range from 0.25 lx to 16 klx
- 100 Hz and 120 Hz flicker noise rejection

THIS DOCUMENT IS SUBJECT TO CHANGE WITHOUT NOTICE. THE PRODUCTS DESCRIBED HEREIN AND THIS DOCUMENT ARE SUBJECT TO SPECIFIC DISCLAIMERS, SET FORTH AT www.vishay.com/doc?91000
APPLICATION INFORMATION

VCNL4020 is a cost effective solution of proximity and ambient light sensor with I²C bus interface. The standard serial digital interface is easy to access “Proximity Signal” and “Light Intensity” without complex calculation and programming by external controller. Beside the digital output also a flexible programmable interrupt pin is available.

1. Application Circuit

![Fig. 12 - Application Circuit](image)

Fig. 12 - Application Circuit

Notes

- The interrupt pin is an open drain output. The needed pull-up resistor may be connected to the same supply voltage as the application controller and the pull-up resistors at SDA/SCL. Proposed value R2 should be >1 kΩ, e.g. 10 kΩ to 100 kΩ. Proposed value for R3 and R4, e.g. 2.2 kΩ to 4.7 kΩ, depend also on the I²C bus speed. For detailed description about set-up and use of the interrupt as well as more application related information see AN: “Designing VCNL4020 into an Application”.
- IR_Cathode needs no external connection. The needed connection to the driver is done internally.
2. \textit{I2C} Interface

The VCNL4020 contains seventeen 8 bit registers for operation control, parameter setup and result buffering. All registers are accessible via \textit{I2C} communication. Figure 13 shows the basic \textit{I2C} communication with VCNL4020.

The built in \textit{I2C} interface is compatible with all \textit{I2C} modes (standard, fast and high speed). \textit{I2C} H-level range = 1.7 V to 5 V.

Please refer to the \textit{I2C} specification from NXP for details.

Device Address

The VCNL4020 has a fix slave address for the host programming and accessing selection. The predefined 7 bit \textit{I2C} bus address is set to 0010 011 = 13h. The least significant bit (LSB) defines read or write mode. Accordingly the bus address is set to 0010 011x = 26h for write, 27h for read.

Register Addresses

VCNL4020 has seventeen user accessible 8 bit registers. The register addresses are 80h (register #0) to 90h (register #16).

\begin{table}[h]
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline
\textbf{Bit 7} & \textbf{Bit 6} & \textbf{Bit 5} & \textbf{Bit 4} & \textbf{Bit 3} & \textbf{Bit 2} & \textbf{Bit 1} & \textbf{Bit 0} \\
\hline
config_lock & als_data_rdy & prox_data_rdy & als_od & prox_od & als_en & prox_en & selftimed_en \\
\hline
\end{tabular}
\end{table}

<table>
<thead>
<tr>
<th>config_lock</th>

<td>config_lock</td>
<td>Read only bit. Value = 1</td>
<td>Read only bit. Value = 1 when ambient light measurement data is available in the result registers. This bit will be reset when one of the corresponding result registers (reg #5, reg #6) is read.</td>
<td>Read only bit. Value = 1 when proximity measurement data is available in the result registers. This bit will be reset when one of the corresponding result registers (reg #7, reg #8) is read.</td>
<td>R/W bit. Starts a single on-demand measurement for ambient light. If averaging is enabled, starts a sequence of readings and stores the averaged result. Result is available at the end of conversion for reading in the registers #5(HB) and #6(LB).</td>
<td>R/W bit. Starts a single on-demand measurement for proximity. Result is available at the end of conversion for reading in the registers #7(HB) and #8(LB).</td>
<td>R/W bit. Enables periodic als measurement</td>
<td>R/W bit. Enables periodic proximity measurement</td>
</tr>
</tbody>
</table>

Note

- With setting bit 3 and bit 4 at the same write command, a simultaneously measurement of ambient light and proximity is done. Beside als_en and/or prox_en first selftimed_en needs to be set. On-demand measurement modes are disabled if selftimed_en bit is set. For the selftimed_en mode changes in reading rates (reg #4 and reg #2) can be made only when b0 (selftimed_en bit) = 0. For the als_od mode changes to the reg #4 can be made only when b4 (als_od bit) = 0; this is to avoid synchronization problems and undefined states between the clock domains. In effect this means that it is only reasonable to change rates while no selftimed conversion is ongoing.
Register #1 Product ID Revision Register
Register address = 81h. This register contains information about product ID and product revision.
Register data value of current revision = 21h.

<tr>
<td>Cont. conv. mode</td>
<td>als_rate</td>
<td>Auto offset compensation</td>
<td>Averaging function</td>
<td>(number of measurements per run)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description**

- **Cont. conversion mode**: R/W bit. Continuous conversion mode.  
  Enable = 1; Disable = 0 = DEFAULT  
  This function can be used for performing faster ambient light measurements. This mode should only be used with ambient light on-demand measurements. Do not use with self-timed mode. Please refer to the application information chapter 3.3 for details about this function.

- **Ambient light measurement rate**: R/W bits. Ambient light measurement rate  
  000 - 1 samples/s  
  001 - 2 samples/s = DEFAULT  
  010 - 3 samples/s  
  011 - 4 samples/s  
  100 - 5 samples/s  
  101 - 6 samples/s  
  110 - 8 samples/s  
  111 - 10 samples/s

- **Auto offset compensation**: R/W bit. Automatic offset compensation.  
  Enable = 1 = DEFAULT; Disable = 0  
  In order to compensate a technology, package or temperature related drift of the ambient light values there is a built in automatic offset compensation function.  
  With active auto offset compensation the offset value is measured before each ambient light measurement and subtracted automatically from actual reading.

- **Averaging function**: R/W bits. Averaging function.  
  Bit values sets the number of single conversions done during one measurement cycle. Result is the average value of all conversions.  
  Number of conversions = 2^decimal_value, e.g. 0 = 1 conv., 1 = 2 conv, 2 = 4 conv., ..., 7 = 128 conv.  
  DEFAULT = 32 conv. (bit 2 to bit 0: 101)

**Note**

- If self-timed measurement is running, any new value written in this register will not be taken over until the mode is actualy cycled.

### Register #5 and #6 Ambient Light Result Register

Register address = 85h and 86h. These registers are the result registers for ambient light measurement readings.

The result is a 16 bit value. The high byte is stored in register #5 and the low byte in register #6.

**Description**

- **Modulation delay time**: R/W bits. Setting a delay time between IR LED signal and IR input signal evaluation. This function is for compensation of delays from IR LED and IR photo diode. Also in respect to the possibility for setting different proximity signal frequency. Correct adjustment is optimizing measurement signal level. (DEFAULT = 0)

- **Proximity frequency**: R/W bits. Setting the proximity IR test signal frequency. The proximity measurement is using a square IR signal as measurement signal. Four different values are possible:
  - 00 = 390.625 kHz (DEFAULT)
  - 01 = 781.25 kHz
  - 10 = 1.5625 MHz
  - 11 = 3.125 MHz

- **Modulation dead time**: R/W bits. Setting a dead time in evaluation of IR signal at the slopes of the IR signal. (DEFAULT = 1)
  - This function is for reducing of possible disturbance effects.
  - This function is reducing signal level and should be used carefully.

**Note**
- The settings for best performance will be provided by Vishay. With first samples this is evaluated to:
  - Delay Time = 0 ; Dead Time = 1 and Prox Frequency = 0. With that register#15 should be programmed with 1 (= default value).

Register #16 Ambient IR Light Level Register
Register address = 90h.
This register is not intended to be used by customer.

### 3. IMPORTANT APPLICATION HINTS AND EXAMPLES

#### 3.1 Receiver standby mode

In standby mode the receiver has the lowest current consumption of about 1.5 μA. In this mode only the I²C interface is active. This is always valid, when there are no measurement demands for proximity and ambient light executed. Also the current sink for the IR-LED is inactive, so there is no need for changing register #3 (IR LED current).

#### 3.2 Data Read

In order to get a certain register value, the register has to be addressed without data like shown in the following scheme. After this register addressing, the data from the addressed register is written after a subsequent read command.

![Send Byte/Receive Byte Protocol](image)

The stop condition between these write and read sequences is not mandatory. It works also with a repeated start condition.

**Note**
- For reading out 2 (or more) subsequent registers like the result registers, it is not necessary to address each of the registers separately. After one read command the internal register counter is increased automatically and any subsequent read command is accessing the next register.
Example: read register “Ambient Light Result Register” #5 and #6:
Addressing: command: 26h, 85h (VCNL4020_I2C_Bus_Write_Adr., Ambient Light Result Register #5 [85])
Read register #5: command: 27h, data (VCNL4020_I2C_Bus_Read_Adr., {High Byte Data of Ambient Light Result register #5 [85]})
Read register #6: command: 27h, data (VCNL4020_I2C_Bus_Read_Adr., {Low Byte Data of Ambient Light Result register #6 [86]})

3.3 Continuous Conversion Mode in Ambient Light Measurement
In the following is a detail description of the function “continuous conversion” (bit 7 of register #4)

Standard mode (bit 7 of reg #4 = 0):
In standard mode the ambient light measurement is done during a fixed time frame of 100 ms. The single measurement itself takes actually only appr. 300 μs.
The following figures show examples of this measurement timing in standard mode using averaging function 2 and 8 as examples for illustration (possible values up to 128).

Continuous conversion mode (bit 7 of register #4 = 1):
In continuous conversion mode the single measurements are done directly subsequent after each other.
See following examples in figure 17 and 18

Note
• ≥ Independent of setting of averaging the result is available only after 100 ms.
PACKAGE DIMENSIONS in millimeters

Drawing-No.: 6.550-5319

Not indicated tolerances ± 0.1
TAPE AND REEL DIMENSIONS in millimeters

Reel size "Y"
GS 08 φ180±2 = 3300 Pcs.
GS 18 φ330±2 = 13000 Pcs.

Dimensions in mm
Not indicated tolerances ±0.1

Leader and trailer tape:
Empty Trailer 200mm min.

Direction of pulling out

Parts mounted
Empty Leader 400mm min.

100mm min. with cover tape

Tape position coming out from reel

Unreel direction

Technical drawings according to DIN specifications

Drawing-No: 9.700-5387.01-4
**SOLDER PROFILE**

Devices are packed in moisture barrier bags (MBB) to prevent the products from moisture absorption during transportation and storage. Each bag contains a desiccant.

**DRYPACK**

Floor life (time between soldering and removing from MBB) must not exceed the time indicated on MBB label:

- Floor life: 72 h
- Conditions: $T_{\text{amb}} < 30 \, ^\circ\text{C}$, RH < 60%
- Moisture sensitivity level 4, according to J-STD-020.

**DRYING**

In case of moisture absorption devices should be baked before soldering. Conditions see J-STD-020 or label.

- Devices taped on reel dry using recommended conditions
  - 192 h at 40 °C (+ 5 °C), RH < 5 %.
Disclaimer

ALL PRODUCT, PRODUCT SPECIFICATIONS AND DATA ARE SUBJECT TO CHANGE WITHOUT NOTICE TO IMPROVE RELIABILITY, FUNCTION OR DESIGN OR OTHERWISE.

Vishay Intertechnology, Inc., its affiliates, agents, and employees, and all persons acting on its or their behalf (collectively, “Vishay”), disclaim any and all liability for any errors, inaccuracies or incompleteness contained in any datasheet or in any other disclosure relating to any product.

Vishay makes no warranty, representation or guarantee regarding the suitability of the products for any particular purpose or the continuing production of any product. To the maximum extent permitted by applicable law, Vishay disclaims (i) any and all liability arising out of the application or use of any product, (ii) any and all liability, including without limitation special, consequential or incidental damages, and (iii) any and all implied warranties, including warranties of fitness for particular purpose, non-infringement and merchantability.

Statements regarding the suitability of products for certain types of applications are based on Vishay’s knowledge of typical requirements that are often placed on Vishay products in generic applications. Such statements are not binding statements about the suitability of products for a particular application. It is the customer’s responsibility to validate that a particular product with the properties described in the product specification is suitable for use in a particular application. Parameters provided in datasheets and / or specifications may vary in different applications and performance may vary over time. All operating parameters, including typical parameters, must be validated for each customer application by the customer’s technical experts. Product specifications do not expand or otherwise modify Vishay’s terms and conditions of purchase, including but not limited to the warranty expressed therein.
